

Mental Health & Workplace Wellness Analysis

Business Insights & Recommendations

Project Objective

The objective of this analysis is to identify factors affecting mental wellness, stress, anxiety, depression, productivity, and treatment-seeking behavior. The insights are intended to support data-driven workplace wellness strategies.

1. Mental Health Risk Remains a Significant Concern

Finding: Medium-risk individuals represent the largest segment of the population.

Business Impact: Without timely intervention, medium-risk individuals may progress into high-risk categories, increasing productivity loss and employee well-being concerns.

Recommendation: Implement regular wellness assessments and early-support programs to identify potential risks before they escalate.

2. Remote Employees Experience Higher Anxiety Levels

Finding: Remote workers show relatively higher anxiety levels compared to other work environments.

Business Impact: Elevated anxiety can reduce collaboration, engagement, and overall job satisfaction.

Recommendation: Conduct regular virtual check-ins, wellness sessions, and team engagement activities to strengthen employee support.

3. Social Support Positively Influences Employee Well-being

Finding: Employees with stronger social support networks tend to report lower anxiety levels.

Business Impact: Strong support systems contribute to healthier, more engaged, and productive employees.

Recommendation: Encourage mentorship programs, peer-support initiatives, and collaborative workplace culture.

4. Stress Levels Influence Productivity Outcomes

Finding: Productivity generally declines as stress levels increase.

Business Impact: High stress can negatively affect performance, decision-making, and employee retention.

Recommendation: Introduce stress-management workshops, workload balancing practices, and employee assistance programs.

5. Depression Has a Strong Impact on Mental Wellness

Finding: Mental wellness scores decrease as depression levels increase.

Business Impact: Poor mental wellness can contribute to disengagement, absenteeism, and long-term workforce challenges.

Recommendation: Improve access to counseling services, awareness campaigns, and mental health resources.

Conclusion

The analysis indicates that mental wellness is strongly influenced by depression, anxiety, stress, and social support. Organizations that invest in preventive mental health initiatives, strengthen support networks, and encourage treatment-seeking behavior are more likely to achieve higher employee engagement, improved productivity, and long-term organizational success.
